

Dementia: cases almost tripled in 2050

In 30 years we could reach 153 million sick people, compared to 57 million in 2019. Obesity, hyperglycemia and smoking are complicit in 7 million more cases. And the increase in education instead protects

JANUARY 18, 2022

More and more seniors, the world population is ageing. And, along with age, related pathologies also increase. Dementia, the second leading cause of death overall for those aged over 70, will affect more and more people. If in 2019 Alzheimer's and other similar forms affected around 57 million patients worldwide, in 2050 the figure will probably almost triple, reaching 153 million.
